

HW 1

1 Given a (left) R -module show:

- i. The covariant functor $\text{Hom}_R(M, -)$ is a left-exact functor.

Proof. Let $0 \rightarrow A \xrightarrow{f} B \xrightarrow{g} C \rightarrow 0$ be a short exact sequence. Application of the functor gives a complex

$$0 \rightarrow \text{Hom}_R(M, A) \xrightarrow{f_*} \text{Hom}_R(M, B) \xrightarrow{g_*} \text{Hom}_R(M, C) \rightarrow 0.$$

For exactness at $\text{Hom}_R(M, A)$, suppose $f_*(\alpha) = 0$ for some $\alpha : M \rightarrow A$. Then $f(\alpha(m)) = 0$ for all $m \in M$. Thus, $\alpha(m) = 0$ for all $m \in M$ since f is injective. Thus f_* is injective.

For the exactness at $\text{Hom}_R(M, B)$, suppose $g_*(\beta) = 0$ for some $\beta : M \rightarrow B$. Then $\text{im}(\beta) \subset \ker(g)$. Since f is an isomorphism from A to $\text{im}(A)$, the map $f^{-1}\beta : M \rightarrow A$ is well-defined. Thus, $\beta = f_*(f^{-1}\beta)$ is in the image of f_* . Thus $\ker(g_*) = \text{im}(f_*)$. \square

- ii. This functor is right-exact iff M is a projective R -module.

Proof. In view of part (i), for the functor to be right-exact is the same as saying that g_* surjects onto $\text{Hom}_R(M, C)$ for every surjection $g : B \rightarrow C$. This is the same as saying that every map $M \rightarrow C$ lifts through every surjection $B \rightarrow C$, i.e. M satisfies the definition of projective R -module. \square

2 Given an R -module M and a short exact sequence of R -modules

$$0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0,$$

use the previous problem to show that the sequence induces a long exact sequence:

$$0 \rightarrow \text{Hom}_R(M, A) \rightarrow \text{Hom}_R(M, B) \rightarrow \text{Hom}_R(M, C) \rightarrow \text{Ext}_R^1(M, A) \rightarrow \cdots$$

Proof. Let P_* be a projective resolution of M . Since the P_i are projective we get a s.e.s. of chain complexes $0 \rightarrow \text{Hom}_R(P_*, A) \rightarrow \text{Hom}_R(P_*, B) \rightarrow \text{Hom}_R(P_*, C) \rightarrow 0$. Applying the cohomology functor and the snake lemma gives the desired long exact sequence. \square

3 Regarding \mathbb{Z}_2 as a module over the ring \mathbb{Z}_4 , construct a resolution of \mathbb{Z}_2 by free modules over \mathbb{Z}_4 and use this to show that $\text{Ext}_{\mathbb{Z}_4}^n(\mathbb{Z}_2, \mathbb{Z}_2)$ is nonzero for all n .

Proof. A free resolution is the following:

$$\cdots \xrightarrow{\times 2} \mathbb{Z}_4 \xrightarrow{\times 2} \mathbb{Z}_4 \xrightarrow{\times 2} \mathbb{Z}_4 \xrightarrow{\text{mod } 2} \mathbb{Z}_2 \rightarrow 0.$$

Applying the $\text{Hom}_{\mathbb{Z}_4}(-, \mathbb{Z}_2)$ functor, we get

$$\cdots \xleftarrow{0} \mathbb{Z}_2 \xleftarrow{0} \mathbb{Z}_2 \xleftarrow{0} \mathbb{Z}_2 \xleftarrow{\text{id}} \mathbb{Z}_2 \leftarrow 0.$$

Thus $\text{Ext}_{\mathbb{Z}_4}^n(\mathbb{Z}_2, \mathbb{Z}_2) = \mathbb{Z}_2$ for all $n \geq 1$.
